Assistant Commissioner for Patents
Box Patent Application
Washington, D.C. 20231

Date: 10/10/00, 2000

Sir:

Transmitted herewith for filing is the complete Patent Application of:

Kurt A. CARLSEN

Title: **SYSTEM AND METHOD FOR ABATING THE SIMULTANEOUS FLOW OF SILANE AND ARSINE**

A. Attached are:

- ☒ An application consisting of 16 pages of specification and claims, 2 sheets of formal drawings.
- ☒ An Assignment.
- ☒ An Assignment Recordation Cover Sheet.
- ☒ A Declaration and Power of Attorney.
- ☐ A Declaration and Power of Attorney is not attached. Please file this application in the name of the inventors listed above.

- ☒ A filing date in accordance with 37 CFR §1.10 is requested. The Express Mail Number appears above.
- ☐ A Small Entity Statement.
- ☒ Information Disclosure Statement Cover Sheet.
- ☒ Information Disclosure Statement.

B. Fees:

The filing fee has been calculated as shown below:

For:	No. Filed	No. Extra
Basic Fee		
Total Claims	25	25 - 20 = 5
Indep. Claims	4	4 - 3 = 1
<input type="checkbox"/> Multiple Dependent Claim Presented		

Rate	Fee

INTERNATIONAL BUSINESS MACHINES CORPORATION

**SYSTEM AND METHOD FOR ABATING
THE SIMULTANEOUS FLOW OF SILANE AND ARSINE**

FIELD OF INVENTION

5 The present invention relates generally to the field of scrubbing exhaust gases. More particularly, the present invention is directed to a system and method for abating the simultaneous flow of silane and arsine gases.

BACKGROUND OF THE INVENTION

10 Microelectronics manufacturers utilize a number of different species of gas during the processing of wafers, which are fundamental to the manufacture of semi- and superconductor devices. Wafer processing generally involves discrete steps of growing one or more layers of various materials on a wafer and/or doping particular regions of existing layers to change the electrical characteristics of the original material. Growing a
15 new layer and doping an existing layer typically involves flowing one or more gases into a processing chamber to effect the desired result. Some wafer processing steps require flowing only one type of gas into the processing chamber. However, other wafer processing steps require flowing two or more types of gas simultaneously with one another. Typically, only a portion of the gas(es) flowed through the processing chamber
20 is actually consumed by the particular process. The remaining portion of the gas(es) exits the processing chamber as exhaust gas.

Generally, the exhaust gas must be processed and/or contained so that it does not contaminate the environment. When only a single gas is used for a particular processing
25 step, the processing and/or containment of the gas is generally straightforward, requiring only one type of apparatus, such as a collection tank or scrubber. When two or more gases are used, however, processing the exhaust gases can be more difficult, particularly

when one of the gases is not compatible, or interferes, with the processing of one or more of the other gases.

For example, in trench processing of wafers during the manufacture of DRAM-type memory it is desirable to simultaneously flow a carrier gas, such as silane, and a doping gas, such as arsine, into the wafer processing chamber. Since each of these gases is not used up completely during processing, the unused portions of these gases must be exhausted from the processing chamber and disposed of properly.

The abatement of arsine is a particular problem due to its high toxicity as a hydride and the high toxicity of the arsenic component of arsine. A preferred method of abating arsine is to use a dry resin-type adsorption system comprising a replaceable resin canister. Unfortunately, the relatively large amount of silane present in the exhaust gas is also collected in the resin canister, drastically reducing its useful life and increasing wafer processing cost due to the need to replace the resin canisters more often than if only the arsine were being collected in the resin canister.

Other abatement methods, such as combustion and wet-type scrubbers, are generally not desirable for abating arsine. The combustion of arsine creates a toxic particulate that is difficult to collect and dispose of. Scrubbing arsine with a wet-type scrubbers is not desirable since it would create a large amounts of toxic water that is difficult to dispose of. In addition, water scrubbing is not compatible with silane, which is insoluble and non-reactive with water.

In view of the foregoing, a need exists for an improved exhaust gas scrubbing system, and this solution is provided by the following invention.

SUMMARY OF THE INVENTION

In one aspect, the present invention is directed to an exhaust gas scrubber for removing a chemical component of an exhaust gas of a process chamber located upstream of the scrubber by chemical vapor deposition of a film. The scrubber includes an enclosure defining a chamber for receiving the exhaust gas. The enclosure has a gas inlet and a gas outlet each in fluid communication with the chamber. At least one substrate is contained within the enclosure between the gas inlet and the gas outlet. The substrate has a film deposition surface for receiving the film.

In another aspect, the present invention is directed to a system for processing a semiconductor wafer with a gas having a chemical component. The system comprises a first enclosure defining a first chamber for receiving the semiconductor wafer and the gas. The system further comprises a scrubber that includes a second enclosure defining a second chamber for receiving at least a portion of the gas from the first chamber. The second enclosure has a gas inlet in fluid communication with the first chamber and the second chamber and a gas outlet in fluid communication with the second chamber. At least one substrate is contained within the second chamber and located between the gas inlet and the gas outlet. The substrate has a film deposition surface for receiving a film composed of the chemical component of the gas.

In further aspect, the invention is directed to a method for scrubbing an exhaust gas of a manufacturing process, wherein the exhaust gas comprises a first chemical component and a second chemical component. The method includes the steps of flowing the exhaust gas through an enclosure that defines a chamber and contains at least one substrate and causing the first chemical component to be chemical vapor deposited onto the at least one substrate.

BRIEF DESCRIPTION OF THE DRAWINGS

For the purpose of illustrating the invention, the drawings show a form of the invention that is presently preferred. However, it should be understood that the present invention is not limited to the precise arrangements and instrumentalities shown in the drawings.

5

FIG. 1 is a schematic diagram illustrating a wafer processing system incorporating an abatement apparatus according to the present invention.

10

FIG. 2 is a cross-sectional view of one embodiment of a chemical vapor deposition chamber that is part of the abatement apparatus illustrated in FIG. 1.

FIG. 3 is a cross-sectional view of the chemical vapor deposition chamber of FIG. 2 as taken along line 3-3.

15

FIG. 4 is a cross-sectional view of another embodiment of a chemical vapor deposition chamber that is part of the abatement apparatus illustrated in FIG. 1.

FIG. 5 is a cross-sectional view of the chemical vapor deposition chamber of FIG. 4 as taken along line 5-5.

20

FIG. 6 is a cross-sectional view of the chemical vapor deposition chamber of FIG. 4 as taken along line 6-6.

DETAILED DESCRIPTION OF THE INVENTION

25 Referring now to the drawings, wherein like numerals indicate like elements, FIG. 1 illustrates in accordance with the present invention a dynamic random access memory (DRAM) processing system, which is denoted generally by the numeral 10. DRAM

processing system 10 is used for fabricating DRAM devices on silicon wafers (not shown). During one step of the DRAM processing, silane as a carrier gas and arsine as an n-type dopant gas are flowed simultaneously with one another to grow an n-doped layer of silicon by chemical vapor deposition (CVD).

5

The silane and arsine are not completely consumed in growing the n-doped silicon layer, and, thus, the exhaust gas contains a mixture of silane and arsine that must be scrubbed to remove harmful components. Arsine is extremely toxic as a gas and also contains the highly toxic component arsenic, which makes abating the arsine in the exhaust gas a problem, particularly when combined with silane. A known and effective method for abating arsine is to use a resin-type adsorber. However, the silane present in the exhaust gas prematurely clogs the adsorber. DRAM processing system 10 of the present invention, therefore, comprises a means for abating the silane before reaching the adsorber.

10

15

Although the present invention is illustrated in the context of DRAM processing system 10, one skilled in the art with readily recognize that the present invention is not limited to DRAM processing. On the contrary, the system and method of the present invention may be used in connection with any type of processing, microelectronic or otherwise, that utilizes a gas, silane or otherwise, having a constituent component that may be removed from the gas in a manner contemplated by the present invention.

20

DRAM processing system 10 includes a processing chamber 12, wherein the processing of a wafer (not shown) to form DRAM devices takes place. As mentioned above, the wafer processing includes a CVD/doping step utilizing the simultaneous flow of silane and arsine. This step is performed at growing/doping conditions known to those skilled in the art. Therefore, the particulars of this processing step are not described in detail

25

herein. The silane and arsine gases are flowed into processing chamber 12 from gas sources 14, 16 and the portion of the gases not consumed in the processing chamber are exhausted from the processing chamber by a pump 18. Pump 18 pumps the exhaust gas first through a CVD abatement apparatus 20 and then to a resin-type adsorber 22.

5

CVD abatement apparatus 20 scrubs the exhaust gas by preferably removing most, and more preferably removing all, of the silicon from the silane by CVD. In this manner, most or all of the silicon is removed from the exhaust gas before the exhaust gas reaches adsorber 22 so that the silicon does not prematurely clog the adsorber.

10

Referring to FIG. 2, CVD abatement apparatus 20 comprises an enclosure 24 that defines a CVD chamber 26, a gas inlet 28 and a gas outlet 30. Enclosure 24 contains a plurality of substrates 32 onto which the silicon from the silane is deposited by CVD. As used herein and in the claims appended hereto, the term "substrate" means any structure having a surface onto which a component of the exhaust gas may be deposited by vapor deposition. This meaning, therefore, encompasses the disc-shaped substrates 32 shown as well as enclosure 24, which has interior walls capable of receiving vapor deposited material.

15

Enclosure 24 and substrates 32 are preferably made of quartz to withstand the relatively high operating temperatures necessary for depositing the silicon. However, other materials, such as graphite, may be used. Gas inlet 28 is in fluid communication with CVD chamber 26 and receives the exhaust gas from pump 18. Gas outlet 30 is also in fluid communication with CVD chamber 26 and allows the exhaust gas to pass from the CVD chamber to adsorber 22.

25

Enclosure 24 is preferably a cylindrical tube and substrates 32 are preferably disc-shaped as shown. However, enclosure 24 may be another tubular shape or may be configured otherwise, such as an enclosure having a plurality of interior walls forming a serpentine chamber within the enclosure. Similarly, substrates 32 may be another shape, such as rectangular, oval, among others, to suit a particular application. In addition, although a plurality of substrates 32 are preferred, a single substrate may be used. Moreover, substrates 32 are preferably arranged within enclosure 24 to form a series of baffles, which slow down the flow of the exhaust gas and allows more silicon to be deposited onto the substrates. One skilled in the art will recognize the variety of enclosure and substrate shapes and arrangements that may be used in accordance with the present invention.

Referring to FIG. 3, each of substrates 32 includes a plurality of apertures 34, which allow the exhaust gas to pass therethrough as it flows through CVD chamber 26 from gas inlet 28 to gas outlet 30. The number, shape and size of apertures 34 may be varied on each substrate 28 and among a number of substrates to suit a particular application, depending on design parameters such as number of substrates, amount of silane contained in the exhaust gas and velocity of exhaust gas through CVD chamber 26. In one embodiment, a substrate 32 includes nine apertures each having a diameter of 0.75 inches. Substrates 32 are preferably removably mounted within CVD chamber 26 so that they may be periodically removed, cleaned of the deposited silicon and replaced for further use. The deposited silicon may be removed from substrates 32, e.g., by chemical etching. Providing removable and reusable substrates 32 will reduce the lifetime cost of operating the CVD abatement apparatus. However, if desired, substrates 32 need not be removable. In this situation, entire enclosure 24 and substrates 32 may be disposed of when the silicon deposits on the substrates reach a maximum thickness.

To deposit silicon from the silane onto substrates 32 using CVD, the temperature of the substrates and/or gas entering chamber should be about 800°C to about 1200°C, more preferably about 1100°C. Thus, CVD abatement apparatus 20 includes a heater (not shown) to heat CVD chamber 26, substrates 32 or both.

5

FIGS. 4-6 shows an alternative embodiment of CVD abatement apparatus 20 comprising an enclosure 24' containing six substrates 32' forming a series of baffles that define a generally serpentine CVD chamber 26' within the enclosure. Enclosure 24' comprises a cylindrical tube similar to enclosure 24 described above. Each substrate 32' is generally a truncated disc located within enclosure 24' such that an opening 36 is defined between the substrate and the interior wall of the enclosure. Openings 36 are alternately located on opposite sides of a horizontal plane 38 bisecting enclosure 24' along its length such that an exhaust gas flowing from gas inlet 28' to gas outlet 30' is slowed by substrates 32' and forced to follow a generally serpentine path 40 through the enclosure. Although enclosure 24' is shown as having a circular cross-sectional shape, another shape such as oval, hexagonal and square, among others, may be used. In addition, although substrates 32' are shown as being truncated discs, the substrates may be configured otherwise. For example, for cylindrical enclosure 24', each substrate may be disc-shaped and have one or more apertures in lieu of the truncated portion of substrates 32'.

10

15

20

Moreover, path 40 may be other than serpentine such as, e.g., spiral. A spiral path may be formed, e.g., by positioning each opening 36 spaced 90° apart from the preceding opening, progressing from gas inlet 28' to gas outlet 30'.

25

Alternative embodiments of DRAM processing system 10 of the present invention may include other components not shown in FIG. 1. For example, DRAM processing system 10 may further include a diverter (not shown) and wet-type scrubber (not shown) both downstream of pump 18 for abating hydrogen chloride (HCL) gas flowed through

system 10 non-simultaneously with the silane and arsine to affect another step of the wafer processing. In this embodiment, the diverter is used to divert the HCL gas away from CVD abatement apparatus 20 and adsorber 22 to the wet-type scrubber. When the silane and arsine are again flowed through processing chamber 12, the diverter would then be used to divert the exhaust gas from the wet-type scrubber to CVD abatement apparatus 20 and adsorber 22. In addition, another type of abatement apparatus may be substituted for resin-type adsorber 22, which is provided specifically for abating arsine. For example, other gases may require a wet-type scrubber.

In alternative embodiments of the invention, the components of the processing system may be arranged differently from the components of DRAM processing system 10. For example, in another type of processing system, pump 18 may be located downstream of CVD abatement apparatus 20. In addition, one or more components, such as pump 18 and adsorber 22, may be eliminated from the system. For example, in a positive pressure system, wherein the processing in the processing chamber is carried out under positive pressure, a pump may not be necessary. In this case, one or more pressure regulators located downstream of gas sources 14, 16 may be used to control the positive pressure that would force the exhaust gas through CVD abatement apparatus. Adsorber 22 may be eliminated if the effluent gas of CVD abatement apparatus 20 does not require further scrubbing. For example, depending upon the particular process, the effluent gas of CVD abatement apparatus 20 may contain only non-toxic components such that the effluent gas need only be contained in a holding tank. One skilled in the art will appreciate the various and diverse processing systems that may be designed to utilize the CVD abatement apparatus and method of the present invention.

While the present invention has been described in connection with a preferred embodiment, it will be understood that it is not so limited. On the contrary, it is intended

	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	2037	2038	2039	2040	2041	2042	2043	2044	2045	2046	2047	2048	2049	2050	2051	2052	2053	2054	2055	2056	2057	2058	2059	2060	2061	2062	2063	2064	2065	2066	2067	2068	2069	2070	2071	2072	2073	2074	2075	2076	2077	2078	2079	2080	2081	2082	2083	2084	2085	2086	2087	2088	2089	2090	2091	2092	2093	2094	2095	2096	2097	2098	2099	2100	2101	2102	2103	2104	2105	2106	2107	2108	2109	2110	2111	2112	2113	2114	2115	2116	2117	2118	2119	2120	2121	2122	2123	2124	2125	2126	2127	2128	2129	2130	2131	2132	2133	2134	2135	2136	2137	2138	2139	2140	2141	2142	2143	2144	2145	2146	2147	2148	2149	2150	2151	2152	2153	2154	2155	2156	2157	2158	2159	2160	2161	2162	2163	2164	2165	2166	2167	2168	2169	2170	2171	2172	2173	2174	2175	2176	2177	2178	2179	2180	2181	2182	2183	2184	2185	2186	2187	2188	2189	2190	2191	2192	2193	2194	2195	2196	2197	2198	2199	2200	2201	2202	2203	2204	2205	2206	2207	2208	2209	2210	2211	2212	2213	2214	2215	2216	2217	2218	2219	2220	2221	2222	2223	2224	2225	2226	2227	2228	2229	2230	2231	2232	2233	2234	2235	2236	2237	2238	2239	2240	2241	2242	2243	2244	2245	2246	2247	2248	2249	2250	2251	2252	2253	2254	2255	2256	2257	2258	2259	2260	2261	2262	2263	2264	2265	2266	2267	2268	2269	2270	2271	2272	2273	2274	2275	2276	2277	2278	2279	2280	2281	2282	2283	2284	2285	2286	2287	2288	2289	2290	2291	2292	2293	2294	2295	2296	2297	2298	2299	2300	2301	2302	2303	2304	2305	2306	2307	2308	2309	2310	2311	2312	2313	2314	2315	2316	2317	2318	2319	2320	2321	2322	2323	2324	2325	2326	2327	2328	2329	2330	2331	2332	2333	2334	2335	2336	2337	2338	2339	2340	2341	2342	2343	2344	2345	2346	2347	2348	2349	2350	2351	2352	2353	2354	2355	2356	2357	2358	2359	2360	2361	2362	2363	2364	2365	2366	2367	2368	2369	2370	2371	2372	2373	2374	2375	2376	2377	2378	2379	2380	2381	2382	2383	2384	2385	2386	2387	2388	2389	2390	2391	2392	2393	2394	2395	2396	2397	2398	2399	2400	2401	2402	2403	2404	2405	2406	2407	2408	2409	2410	2411	2412	2413	2414	2415	2416	2417	2418	2419	2420	2421	2422	2423	2424	2425	2426	2427	2428	2429	2430	2431	2432	2433	2434	2435	2436	2437	2438	2439	2440	2441	2442	2

What is claimed is:

- 1 1. An exhaust gas scrubber for removing a chemical component of an exhaust gas of
2 a process chamber located upstream of the scrubber by chemical vapor deposition
3 of a film, the scrubber comprising:
4 a. an enclosure defining a CVD chamber for receiving the exhaust gas, said
5 enclosure having a gas inlet for receiving the exhaust gas from the process
6 chamber and a gas outlet each in fluid communication with said CVD
7 chamber; and
8 b. at least one substrate contained within said enclosure between said gas
9 inlet and said gas outlet, said substrate having a film deposition surface for
10 receiving the film.
- 1 2. An exhaust gas scrubber according to claim 1, wherein said at least one substrate
2 is made of quartz.
- 1 3. An exhaust gas scrubber according to claim 1, wherein said at least one substrate
2 forms a baffle.
- 1 4. An exhaust gas scrubber according to claim 3, wherein said baffle includes a
2 plurality of apertures for allowing the exhaust gas stream to flow through said
3 baffle.
- 1 5. An exhaust gas scrubber according to claim 1, further comprising a plurality of
2 said substrates forming a series of baffles within said chamber.

1 6. An exhaust gas scrubber according to claim 5, wherein each baffle of said series
2 of baffles includes a plurality of apertures for allowing the exhaust gas stream to
3 flow through each of said series of baffles.

1 7. An exhaust gas scrubber according to claim 5, wherein said series of baffles are
2 positioned at an angle to define a serpentine or spiral passageway within said
3 CVD chamber.

1 8. An exhaust gas scrubber according to claim 1, further comprising a heating
2 element for heating at least one of said enclosure and said at least one substrate.

1 9. An exhaust gas scrubber according to claim 1, wherein said at least one substrate
2 is removable and reusable after the film has been removed.

1 10. An exhaust gas scrubber according to claim 1, wherein the chemical component
2 of the exhaust gas is silicon.

1 11. A system for processing a semiconductor wafer with a gas having a chemical
2 component, comprising:
3 a. a first enclosure defining a first chamber for receiving the semiconductor
4 wafer and the gas; and
5 b. a scrubber comprising:
6 i. a second enclosure defining a second chamber for receiving at least
7 a portion of the gas from said first chamber, said second enclosure
8 having a gas inlet in fluid communication with said first chamber
9 and said second chamber and a gas outlet in fluid communication
10 with said second chamber; and

11 ii. at least one substrate contained within said second chamber and
12 located between said gas inlet and said gas outlet, said substrate
13 having a film deposition surface for receiving a film composed of
14 the chemical component of the gas.

1 12. A system according to claim 11, further comprising a pump located between said
2 first chamber and said second chamber for pumping the gas from said first
3 chamber to said second chamber via said gas inlet.

1 13. A system according to claim 11, further comprising a heating element for heating
2 at least one of said second enclosure and said at least one substrate.

1 14. A system according to claim 11, further comprising an abatement device for
2 removing at least one component of the exhaust gas not deposited on said
3 substrate.

1 15. A scrubber for scrubbing a gas containing a non-toxic part and a toxic part, the
2 scrubber comprising:
3 a. a first enclosure defining a first chamber for receiving the gas, said first
4 chamber for removing at least a portion of the non-toxic part of the
5 exhaust gas by chemical vapor deposition; and
6 b. a second enclosure defining a second chamber in fluid communication
7 with said first chamber, said second chamber for receiving at least a
8 portion of the gas, said second chamber for removing at least a portion of
9 the toxic part from the gas.

1 16. A scrubber according to claim 15, further comprising a substrate located in said
2 first enclosure, said substrate for receiving by chemical vapor deposition a film
3 containing the non-toxic part of the gas.

1 17. A scrubber according to claim 15, wherein the non-toxic part comprises silicon.

1 18. A scrubber according to claim 15, wherein the toxic part comprises arsenic.

1 19. A method for scrubbing an exhaust gas of a manufacturing process, the exhaust
2 gas comprising a first chemical component and a second chemical component,
3 comprising the steps of:

- 4 a. flowing the exhaust gas through an enclosure defining a chamber and
5 containing at least one substrate; and
6 b. causing the first chemical component to be chemical vapor deposited onto
7 said at least one substrate.

1 20. A method according to claim 19, further comprising the step of removing the
2 second chemical component from the exhaust gas after performing step b).

1 21. A method according to claim 19, wherein step b) is performed by heating at least
2 one of said at least one substrate and said enclosure to at least 800°C.

1 22. A method according to claim 21, wherein step b) is performed by heating at least
2 one of said at least one substrate and said enclosure to at least 1100°C.

1 23. A method according to claim 19, wherein the first chemical component is non-
2 toxic and the second chemical component is toxic.

1 24. A method according to claim 23, wherein the first chemical component comprises
2 silicon and the second chemical component comprises arsenic.

1 25. A method according to claim 19, further comprising after step b) the steps of:
2 a. removing said at least one substrate from said enclosure;
3 b. cleaning said at least one substrate of any film deposited thereon;
4 c. installing said at least one substrate in said enclosure; and
5 d. again causing the first chemical component to be chemical vapor deposited
6 onto said at least one substrate.

SYSTEM AND METHOD FOR ABATING THE SIMULTANEOUS FLOW OF SILANE AND ARSINE

Abstract

5 A system and method for abating a simultaneous flow of silane and arsine contained in an
exhaust gas of DRAM processing chamber (12). The system includes a CVD abatement
apparatus (20) and a resin-type adsorber (22). The CVD abatement apparatus comprises
an enclosure (24) that defines a chamber (26) for receiving the exhaust gas. The
10 enclosure contains a plurality of removable substrates (32) arranged as a series of baffles
inside the enclosure. As the exhaust gas flows through the CVD abatement apparatus, the
silicon within the silane is deposited as a film upon the substrates by chemical vapor
deposition. The arsine continues to flow through the CVD apparatus to the adsorber
where it is adsorbed by the resin contained therein. After the film has reached a particular
thickness, the substrates can be removed from the enclosure, cleaned of the film and
returned to the enclosure for further use.

Declaration and Power of Attorney for Patent Application

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name; I believe I am the original, first and sole inventor of the subject matter which is claimed and for which a patent is sought on the invention entitled:

**SYSTEM AND METHOD FOR ABATING THE SIMULTANEOUS
FLOW OF SILANE AND ARSINE**

the specification of which (check one)

- ☒ is attached hereto.
- ☐ was filed on _____, 2000, as United States Application Serial No. _____.

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information that is material to the patentability of this application in accordance with Title 37, Code of Federal Regulations, §1.56.

I hereby claim foreign priority benefits under Title 35, United States Code, §119(a)-(d) of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed:

Prior Foreign Application(s): NONE.

Number	Country	Day/Month/Year	Priority Claimed Yes/No
_____	_____	_____	_____
_____	_____	_____	_____
_____	_____	_____	_____

I hereby claim benefit under Title 35, United States Code, §119(e) of any United States provisional applications listed below: NONE.

Provisional Application Number	Filing Date
_____/_____	_____
_____/_____	_____

I hereby claim the benefit under Title 35, United States Code, §120 of any United States application(s) listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application in the manner provided by the first paragraph of Title 35, United States Code, §112, I acknowledge the duty to disclose information material to the patentability of this application as defined in Title 37, Code of Federal Regulations, §1.56 which occurred between the filing date of the prior application and the national or PCT international filing date of this application:

Prior U.S. Applications: NONE.

Serial No.	Filing Date	Status (patented, pending, abandoned)
